

TitanSecure

Triple Threat Protection

Multi-layered Security For MSPs

WEB SECURITY LAYER

- Advanced Threat Protection
- Command & Control Attacks
- Drive-by Downloads
- Malicious Sites
- Phishing Sites
- Ransomware
- IoT Botnets
- Malware
- Spyware
- Botnets

EMAIL SECURITY LAYER

- Advanced Persistent Threats (APT)
- Inbound & Outbound Layer
- Data Leak Prevention
- Zero Day Protection
- Rapid Cyber Attacks
- Phishing Attacks
- Virus Protection
- Anti Spoofing
- Ransomware
- Malware
- Spam

EMAIL ARCHIVING & CONTINUITY LAYER

- Office 365 Enhancer
- Business Continuity
- Prevent Data Loss
- Fastest Search
- Offsite Storage
- Safe & Secure
- Compliant
- Remote

Partnering with MSPs since 1999

The number of cybersecurity incidents threatening our organizations is climbing at an alarming rate. Advanced threats require advanced solutions. We developed our MSP Alliance Program and TitanSecure to meet the specific security requirements for MSPs and their SMB customers. TitanSecure offers three vital layers of security against today's cybercriminals. Defense in depth requires advanced security tools, particularly as organizations become more reliant on multiple vectors of messaging, mobile workers and the Internet of Things devices. Implementing the best layered security model is a challenging task, but with TitanSecure we make it easier.

EMAIL SECURITY LAYER

Email is the number-one mission critical application used to communicate. It's also the number-one vector for cyberattacks. Email-based threats have grown in sophistication, making strong email protection a vital component of the security stack. Your organization needs an email protection layer that is easy to manage, lowers costs and is highly effective in preventing attacks. It is vital this layer works seamlessly with the other security layers deployed. The TitanSecure email security layer prevents and blocks malware, ransomware, spam, viruses, phishing attacks and spoofing attempts.

Powerful Anti-Spam and Anti-Malware blocking

- » Double antivirus protection, including Bitdefender & Clam AV engines. Both inbound and outbound mail is scanned for viruses.
- » Content Control that can be managed by administrator or at user level
- » LDAP, Dynamic and aliases file recipient verification
- » SASL authentication
- » Advanced features for outbound mail scanning and routing
- » IP protection control

TitanSecure's attachment scanning, machine-learning and real-time IP reputation scanning can detect suspicious language and sender aspects. SpamTitan can unpack files (like .zip and .rar) and block executables to examine for potentially malicious programs.

EMAIL ARCHIVING & CONTINUITY

The final layer included in TitanSecure is the email archiving and business continuity layer. TitanSecure goes beyond traditional archiving by creating a secure, cloud based, easily searchable, tamper proof archive for corporate data.

Archiving data in a secure location reduces costs and risks for legal and compliance teams. The archiving layers provides an easy to use system where you can easily access and search your archive data improving employee productivity and efficient workflow efficiency.

The TitanSecure email archiving and business continuity layer prevents data loss, provides safe and secure off site storage and provides business continuity.

WEB SECURITY LAYER

As Ransomware and drive by download attacks are at an all-time high, responsible organizations desperately need solutions that proactively protect against both new and existing web born malware, without the need to recognize known or identifiable signatures or behaviors. Our web security layer provides real-time malicious detection for the billions of URLs/IPs that compromise the active web. This provides a vital layer of malware and ransomware protection before users ever access malicious URL's.

The Stats That Matter

- » 700 million URL's crawled daily providing crowd-sourced categorization and threat protection
- » 200 languages covered
- » 5 trillion search queries examined monthly
- » 3 million malicious URLs & phishing sites blocked at any one time
- » 100,000 new malicious and phishing site entries daily
- » 300,000 malicious URLs revisited every single day
- » 100% coverage of the Top 1 Million most visited websites
- » 99% coverage & accuracy of the entire active web, the industry leader.
- » 53 Unique Content Categories
- » 200,000 queries per second/per instance
- » 5 microseconds for database lookups
- » 1 Vital DNS Security Layer

This includes over 550 million end users and growing-and is the primary in-house source for threat corpora used to train human-supervised Machine Learning systems.

This combined and integrative approach empowers us to continuously enhance, optimize, and fine-tune our malicious detection capabilities in an ever-changing threat landscape.

The TitanSecure web security layer prevents and blocks malware, ransomware, malicious sites, spyware, phishing sites, command and control attacks and botnets.
